Chords in blues style - part 1

A simple way to create a noticable effect in blues is to slide down from a black key to a white key. This is indicated by small eight note with diagonal line trough. It sounds best if it's done in a single sequence together with the notes that follows.

Getting to the next level, you can include a shuffle pattern in the left hand.

Another idea is to let the chord expand and move from major triad to F/C in the case of C, to dominant 7th and halways back.

In this example the C chord are part of a lick. This is one of many ways you can combine a chord with a pentatonic blues scale.
